

● ERC SERIES

ERC serie electromagnets are simple effect linear solenoids where the stroke movement from initial to final position is made by electromagnetic forces, the return to initial position is made by external force or by a spring incorporated to the solenoid. They are similar to ER series but with a higher life expressed in number of cycle due to its guide made in friction bearing with teflon layer.

Structure, main basic elements:

Magnetic body:

It is the metal **carcase** containing the **coil**, the core and the fixing holes of the solenoid and the sliding bearings.

Coil:

It receives the electric energy to create the magnetic field.

Plunger:

It is the piece that moves inside the **coil**, and it has a non-magnetic **shaft** fixed to it.

To work pulling, the element to activate must be fixed to the **plunger**. To work pushing, the element to activate must be fixed to the **shaft**.

Sliding bearings:

They are the components which guide the plunger.

● Datasheet rated values conditions (According to DIN VDE 0580):

The values of the magnetic force (F_m) depending on the stroke, are obtained in the following conditions:

Room temperature = 35°C

Coil stabilized at its working temperature.

Rated voltage equal to 90% of the standard one.

Solenoid working in horizontal position.

Effective force (F_h) is obtained from magnetic force (F_m).

-When the solenoid pulls upwards:

$Effective\ force = Magnetic\ force - Plunger\ weight$

-When the solenoid pulls downwards:

$Effective\ force = Magnetic\ force + Plunger\ weight$

-When the solenoid pulls in horizontal position:

$Effective\ force = Magnetic\ force$

-For the units with incorporated return spring:

$Effective\ force = Magnetic\ force - Spring\ force \pm Plunger\ weight$

NOTE: When mounting position 3) slide bearings abrasion is bigger than mounting options 1) and 2)

● Terminals placement with fixing holes as reference:

● Important:

The fixation screws do not have to exceed the wall of the magnetic body not to damage the coil

The mounting of the specification sheets is the standard one, under demand they can be mounted in the different positions shown above. It must be specified in the order. Under demand, terminals can be replaced by flying leads.

• ERC series: Force-stroke Chart

Type	Stroke (mm)		Duty-cycle					Return Spring force (N)
			100%	40%	25%	15%	5%	
ERC25-04/CC	Beginning of stroke $s_1=4$	Magnetic force "Fm" (N)	4.4	8.2	10.6	14	23	2
	End of stroke $s_0=0$		12.4	17.6	20.6	25.4	36.8	3.6
ERC30/C	Beginning of stroke $s_1=8$		3	6	9	12	21	0.6
	End of stroke $s_0=0$		10	15	19	24	35	1.6
ERC35/C	Beginning of stroke $s_1=12$		2.6	5.8	7.9	10.5	21	0.8
	End of stroke $s_0=0$		5.6	9.5	12.9	18	27.7	2
ERC45-50-15/C	Beginning of stroke $s_1=15$		4.5	9.3	12	16	32	1.8
	End of stroke $s_0=0$		16	33	42	50	83	3.6
ERC50-15/C	Beginning of stroke $s_1=15$		6.8	12.8	17	23	43	1.8
	End of stroke $s_0=0$		20	34	42	52	76	3.6
ERC60-10/C	Beginning of stroke $s_1=10$		19	33	43	56	94	3.2
	End of stroke $s_0=0$		81	119	140	160	191	4.3
ERC60-20/C	Beginning of stroke $s_1=20$		11	19	24	32	57	2.1
	End of stroke $s_0=0$		34	64	80	105	143	4.3

The values of force-stroke and the return spring are in Newton (N), solenoid in horizontal position and without return spring.

Beginning of stroke (s_1)

End of stroke (s_0)

• CUSTOMIZATION ERC SERIES

The models described in the catalogue are standard and minimum manufacturing batches are not required. However, there is the possibility of customizing them to suit better customer's needs. See below some of the most common customizations.

If any modification is needed, please ask NAFSA about the possibility and the minimum manufacturing batch required.

1. ELECTRICAL CUSTOMIZATION:

a) Integrated electronics over the coil:

a.1) For peak suppression

Examples:

*Free wheel diode

*Varistor

*Free wheel diode+second diode to protect the free wheel diode against reverse polarity

a.2) Thermal protection

Examples:

*The thermic resettable polyswitches are used in coils with low duty cycles against overheating, caused by long time under voltage and not respected the duty cycle times. It can be used also as timer.

a.3) For rectification

Examples:

*Half wave rectification, with free wheel diode and varistor input protection.

a.4) PWM electronics integration:

It consists on feeding the electromagnet through an electronic PWM (Pulse width modulation). This device will initially provide the solenoid with its nominal voltage and after a while, which will be higher than the one needed to complete its stroke, the voltage entering to the solenoid will be reduced by the PWD to the selected ratio. For instance, the most common reduction ratio values are 1:2 or 1:3. Once the voltage is reduced it will be maintained in its value until the supply to the solenoid is off, once off, the system resets and when the solenoid works again, the cycle is repeated.

The idea is to make the solenoid to be 100% duty-cycle, but with a big force when the stroke has to be done, the force of a reduced duty cycle, as per example 25%, so it can be feeded long as required but without the risk of burning.

The solution is used when the initial stroke force in a 100% duty-cycle solenoid isn't enough or in those cases where a lower heating of the solenoid is required. For example, a 12Vdc and ED100% solenoid can be feeded at 24VDC through an PWM electronic and if it has 1:2 ratio, the solenoid will first see the 24VDC so it will complete the stroke with 4 times more power, so with the force of a 25% duty cycle, then when the voltage is reduced to 12VDC the duty cycle will be 100%.

b) Cable length modification and terminal or connector mounted over cables:

In all ERC models terminals can be replaced by supply cables. The standard length of cables is 250mm, this dimension can be modified to customer requirement.

Likewise, many different kind of terminals or connectors may be added to the cables.

c) Intermediate duty-cycle manufacturing:

NAFSA can manufacture any intermediate duty-cycle from 0 to 100, but the viability depends on the model and the voltage associated with it. For any special requirement, please ask NAFSA.

2. INSULATION CLASS CUSTOMIZATION:

In the ER series maximum insulation class can be obtained is F (155°C),

3. PROTECTION RATE IP (EN60529) CUSTOMIZATION:

Standard models are IP00, but IP40 can be obtained to the mechanical part and IP65 to the electrical part by coil overmolding process.

*PWD over coil

Example 1:

*PWD over the cables

Example 2:

Example 3:

Example 4:

Example 5:

NOTE: All this customizations cannot be applied to all models, ask NAFSA for each case.

● CUSTOMIZATION ERC SERIES

The models described in the catalogue are standard and minimum manufacturing batches are not required. However, there is the possibility of customizing them to suit better customer's needs. See below some of the most common customizations.

If any modification is needed, please ask NAFSA about the possibility and the minimum manufacturing batch required.

4. MECHANICAL CUSTOMIZATION:

4.1) Shaft modifications: Length and shape can be modified. If it has not any function, it can be removed depending on the model, this would mean use exterior springs instead of internal ones.

4.2) Plunger modifications: Length and shape can be modified

4.3) Fixing holes modification:

4.4) Return spring force modification:

ER series electromagnets are linear simple effect solenoids, where the stroke movement from initial to the final position is made by electromagnetic forces, and the return to initial position takes place because of external forces or an incorporated spring (depending on the type). The force of the spring is limited to returning the plunger to the initial position. If more force is required, spring can be modified but we will have to take in mind the duty-cycle. Each duty-cycle has a limitation to increase the spring force, as this force will be deducted to the solenoid push/pull force.

In the cases that spring is not required, solenoid can be ordered without spring or it can be removed manually.

4.5) Stroke modifications:

The standard stroke is limited by the usefull length of shaft, in some cases the stroke can be modified: decreasing or increasing it in case that solenoid has enough ativation force. These modifications can be made by customer or NAFSA.

Example:
Stroke decrease:
Inserting a plastic bearing, this can be made by NAFSA or the customer

Example:
Stroke increase:
Shaft has been enlarged to increase the stroke, This modification only can be made by NAFSA.

4.6) Position detection system integration:

Example:

4.7) Fastening element added as Fork joints DIN71752:

Example:

NOTE: All this customizations cannot be applied to all models, ask NAFSA for each case.
